

Garbage at home

DTC - Assignment 3

Varendra Maurya 200010055

There are several issues that individuals globally have with garbage pickup at home. There are still many issues in this area that need to be identified and resolved, despite the fact that there have been several government initiatives and public awareness campaigns.

These were the problems identified in this context, taking into account the location and the time period of the investigation.

I have spoken with few people in and around the campus to gather the following conversation snippets:

- Numerous cats and dogs are seen rummaging through the trash at night, spreading it, and making a lot of noise.
 - This is mostly a result of the lack of a suitable garbage cover. The garbage is out in the open.
 - Another issue is that occasionally the little garbage cans fill up and most of the rubbish spills outside the can. This draws stray animals, who fight, grab, and scatter the rubbish everywhere.
 - It is exceedingly challenging for cleaning staff to gather and properly dispose of waste when it is dispersed across the area.
- Public trash cans are undersized or damaged where we live and nearby.
 - Because so much waste was produced every day, this was also a concern. They struggled to load all the rubbish into the bins without it dispersing since the dustbins were either too tiny or damaged.
 - Dustbins that were damaged weren't replaced with new ones.
- We have to wait for the team to arrive or go a distance to regularly dispose of trash because there isn't a sufficient disposal option nearby.

- Again, little or inadequate bins are to blame for this issue. Temporary disposal becomes quite challenging if the pace of waste creation is very high at a location.
 - There will be a mountain of trash if the staff does not consistently show up.
- Our neighbourhood has a lot of garbage cans, which contributes to a strong odour brought on by decomposition.
 - If the pace of waste generation is excessive, this is another typical issue.
 - The scent is caused by rubbish starting to degrade if the temporary disposal is not handled, for example, because cleaning personnel are not always available.
 - This poses a health risk as well since it draws a lot of insects, including houseflies.
